

Monitoring dynamics of water surface and wetlands areas in the Southern Priaralie

The water surface and wetlands areas in the Southern Priaralie in August 2011 were determined using satellite images in the SIC ICWC (Fig. 1, Table 1,2).

Table 1 contains wetlands with water surface area which could be assessed by using satellite images; it doesn't contain, for example, the former Adjibay gulf and wetland Adjibay 2 because they have no open water surface area what is caused by relief, vegetation phase and water inflow to the Southern Priaralie.

Table 2 contains wetland's areas in the Southern Priaralie in August 2011.

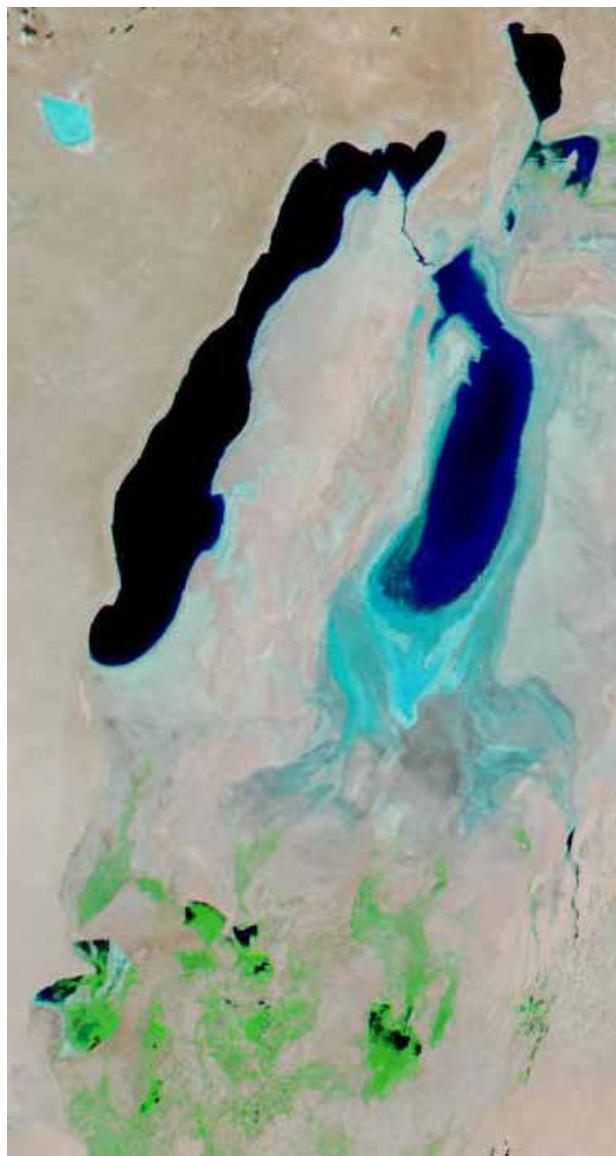

Fig. 1. Southern Priaralie and Big Aral Sea - August 2011

*)Adjibay 2 – Artificial structure to the north from the Rybachie and Muinakskoe reservoirs.

If comparing data from March (the beginning of vegetation period in the Southern Priaralie) till August 2011, the biggest area of lake's overflow is observed in April, but a maximal area of wetlands - in August. Fig. 2 demonstrates relation between water surface area and wetland's areas in the Southern Priaralie.

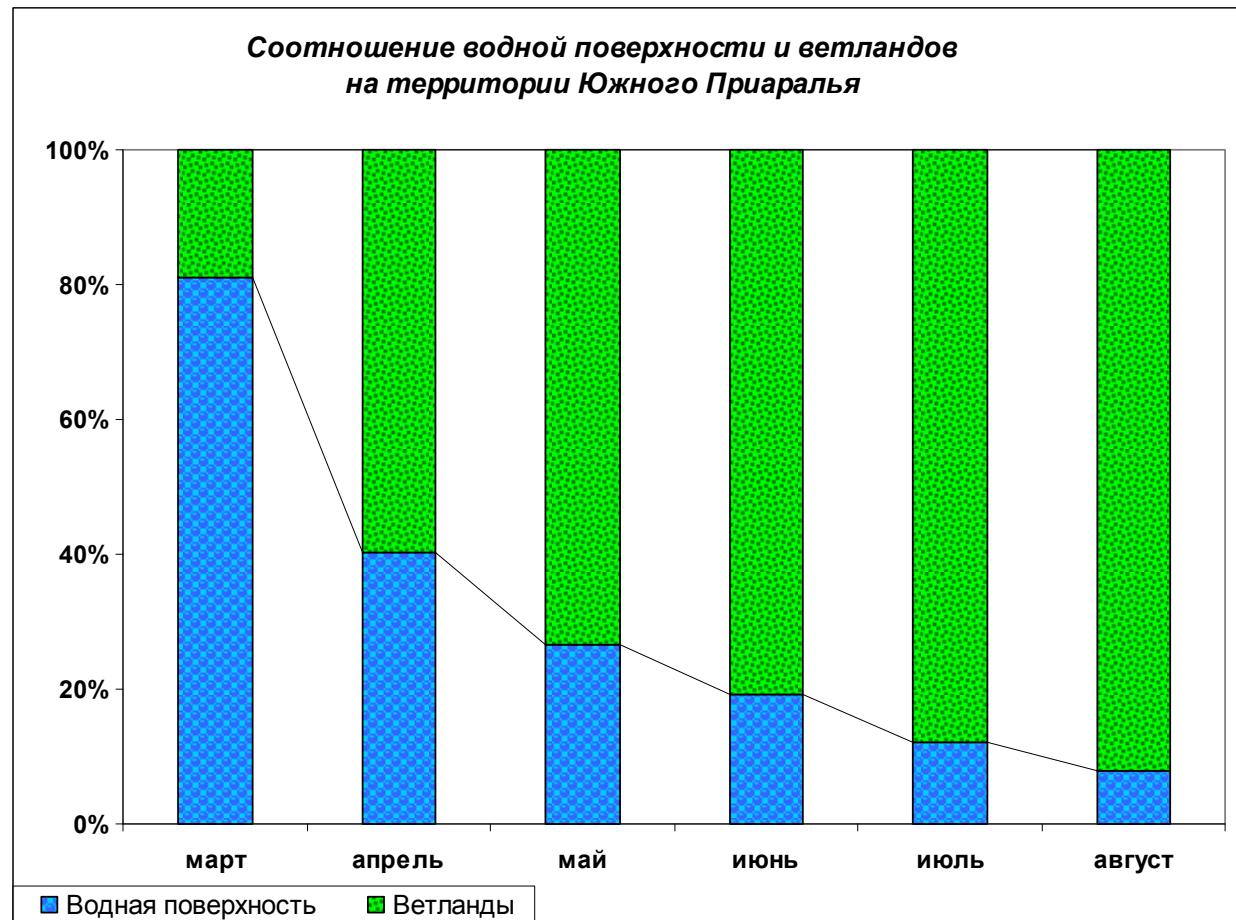

Fig. 2.
[Comparing water surface area with wetland's areas in the Southern Priaralie]

Water surface areas have decreased almost by 79 thousand hectares and wetland's areas have increased by 138 thousand hectares for the period from April till August 2011.
